Figure 5D. Representative genes from instability−only and pooled−only rankings

Instability−only genes capture subgroup−dependent or conflicting behavior, whereas pooled−only genes reflect stable average−prioritized signals.

Gene	Method	Annotation	Behavior	Instability	Interpretation
RvY_02420−1	Instability−only	Calycin−like protein	Opposing regulation (sign flip)	2.98	Opposing subgroup responses masked in pooled analysis
RvY_01282−1	Instability−only	Serine protease (trypsin family)	Opposing regulation (sign flip)	2.89	Opposing subgroup behavior masked by pooling
RvY_07877−1	Instability−only	Uncharacterized protein	Opposing regulation (sign flip)	2.98	High instability independent of functional annotation
RvY_03909	Instability−only	Uncharacterized protein	Opposing regulation (sign flip)	2.90	High instability consistent with heterogeneous subgroup regulation
RvY_03228−1	Pooled−only	Small GTPase (ARF/SAR type)	Consistent pooled response	0.28	Stable average signal prioritized by pooled ranking
RvY_06255−3	Pooled−only	Uncharacterized protein	Consistent pooled response	0.08	Consistent pooled signal with low internal conflict

Instability−only examples include annotated candidates and highly unstable uncharacterized proteins, indicating masked structured biology beyond stable pooled responses.
